Interessi di Ricerca: L'obiettivo della mia ricerca è focalizzato sulla comprensione dei meccanismi cellulari e molecolari alla base dell'espressione genica, a livello co- e post-trascrizionale, con un interesse specifico alla regolazione dello splicing alternativo e della sua modulazione attraverso vie di trasduzione del segnale. Lo splicing alternativo è un processo che produce molteplici trascritti maturi (mRNA) a partire da un singolo RNA primario, dando origine a diverse isoforme proteiche con proprietà strutturali e funzionali distinte, consentendo di espandere il potenziale codificante del nostro genoma.

Lo splicing alternativo è regolato durante il differenziamento cellulare e contribuisce alla normale fisiologia degli organismi multicellulari, compreso il movimento. Alterazioni nel processo di splicing sono alla base di malattie genetiche e contribuiscono a patologie quali il cancro e le malattie neurodegenerative.

Nel nostro laboratorio utilizziamo tecniche high throughput per l'identificazione di nuove isoforme di splicing, sia codificanti che non codificanti, in contesto sia fisiologico che patologico, con un particolare *focus* sul sarcoma di Ewing e la sclerosi laterale amiotrofica.
